

Abstract Format Capstone Design Expo - AI Recommender Tool

Project Team: Jake Carduck, Dylan Tran, Michelle Koh, Kelly Hwangpo
Computer Science
Project Number CS 26-309

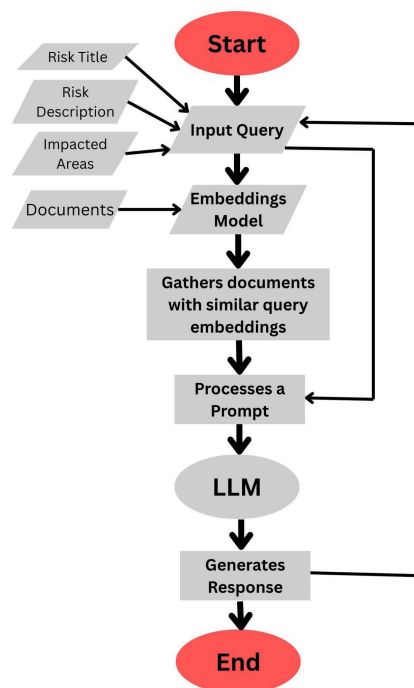

Faculty Advisors: Caroline Budwell, Ph.D., John Leonard, Ph.D.
Sponsor: Capital One
Mentor: Nabin Debnath, Lakshmi Narayana Rasalay

All companies rely on a government, risk, and compliance (GRC) assessment for new job roles, projects, etc. The current process is time consuming, manual, complex, and lacks scalability.

The AI Risk Recommender Tool is a single-page web application designed to help users quickly assess and manage potential risks. It calculates a risk score based on several user-provided inputs, for example: risk title, risk description, impacted areas, number of controls and their descriptions to mitigate the risk, numerical values for probability, control effectiveness etc. The tool categorizes the risk of input as 'High', 'Medium', or 'Low', providing a clear risk level and a set of actionable recommendations based on the assessment. This interactive tool simplifies a key part of the risk management process, turning complex analysis into a straightforward, guided experience.

As a team, we developed a RAG Chatbot, which studies have proven to be scalable and reliable while still performing consistently. The RAG-bot takes in documents provided by the user. The information in the documents and within the user query is used to answer questions raised by the user; as a result, the chatbot is able to answer newer and more specialized topics that traditional LLMs have less information or focus on.
